# FINAL PROJECT GUIDELINES

Dear Students,

The following are the mandatory requirements for the Final Project. The project must demonstrate actual functionality, technical implementation, documentation and testing.

1. Project Structure

- Each member must be responsible for 3 functional modules with clearly identifiable individual contribution.
- Modules must demonstrate relevant UI, validations, processing/business logic and output.
- The project must not be limited to basic CRUD operations.

2. UI & Validations

- Complete and user-friendly UI/navigation
- Proper input, format, range and mandatory-field validations
- Appropriate error/success messages
- Authentication/business-rule validations wherever applicable

3. Database / Data Handling

- Database implementation is required where applicable.
- Database-based projects should have approximately 3–4 relevant tables per module, with appropriate relationships, normalization and CRUD operations.
- Non-database projects are not required to create artificial tables. They must use and document an appropriate alternative such as files, datasets, APIs, logs, model files or other relevant data-handling mechanisms.

4. Business Logic & Outcomes

The project must clearly demonstrate:

- Business logic and conditions
- Processing/decision-making rules
- Expected outcomes
- Appropriate reports, outputs, dashboards or visualizations wherever applicable

5. Documentation

The report must include:

- Introduction, Problem Statement, Objectives & Scope
- SRS
- Functional & Non-functional Requirements

- Feasibility study
- Cost-Benefit Analysis(COCOMO model)
- Development Model & Prototype
- System/Software Design
- System Architecture & relevant diagrams
- Database/ER Diagram, wherever applicable
- Module-wise explanation & functionality
- Business Logic
- Gantt Chart, Project Bar Diagram & Activity Chart showing individual contributions
- Implementation with screenshots and descriptions
- System Testing
- Results, Scope, Future Work & References

6. System Testing

Testing must include:

- Test units/modules
- Test Case ID, Scenario, Input, Expected Result, Actual Result, Status & Remarks
- Testing results and observations
- Coverage of major functionality, validations, business rules and database/data operations

7. Final Submission

- 80–90 page detailed Project Report
- Working Project/Demonstration
- Source Code
- Database/Dataset, wherever applicable
- Presentation
- Testing & Project Documentation

Important: *The report must reflect the actual development process and implementation, not documentation prepared only at the end. Individual contribution must be clearly demonstrable during the presentation and viva.*
